

## *Palm Tree Ring Installation*

Tools needed: 9/16" Hex Bolt Driver Bit, Screw Gun, Ladder, Level

1. Before installing, we recommend testing the ring lights and making sure that no bulbs have become loose during shipping.
2. Two people is recommended for install. Mark the height on the tree that you would like the ring to be installed. It will make it easier to view when you are on the ladder.
3. Undo the winged nut hinge fastener, open up the ring, and wrap it around the tree. At this time, you should align the lights on the side of the tree you want to illuminate.
4. Tighten the winged nut and then, using two ladders, begin to lift the ring to the mark on the tree.
5. Once at the height marked, tighten the 9/16" hex bolts one by one until it is secure centered, and level on the tree.
6. Once the ring is secure, run the electrical up to the conduit box. All connections should be made inside the box.
7. Adjust the lights any way desired and make sure the spotlight bracket is tight so they will not move.
